

Question 1: When asked to create a new 6-digit PIN for a non-critical app, which strategy are you most likely to use?

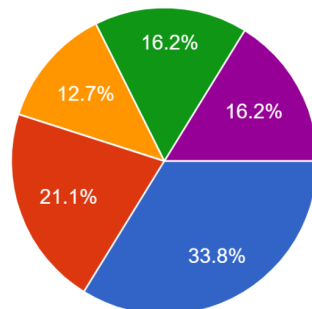

141 responses

- A date (my own birthday, a partner's, or a family member's).
- A significant anniversary or historical date.
- Repeated digits for speed (e.g., 111111, 222222).
- Sequential digits on the keypad (e.g., 123456).
- Numbers with cultural or personal significance.
- Completely random numbers with no discernible pattern.
- bias birthday

Question 2: If you (or people you know) use a date of birth for a 6-digit PIN, which format is the most common? (e.g., March 5th, 1998)

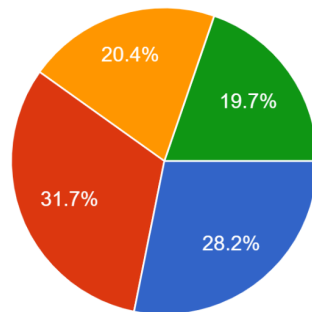

142 responses

- DDMMYY (e.g., -> 050398).
- MMDDYY (e.g., -> 980305).
- YYMMDD (e.g., -> 980305).
- The 4-digit birth year padded with zeros (e.g., -> 199800 or 001998).
- I/They never use dates.

Question 3: Do you tend to reuse the same 6-digit PIN across multiple different apps and services?

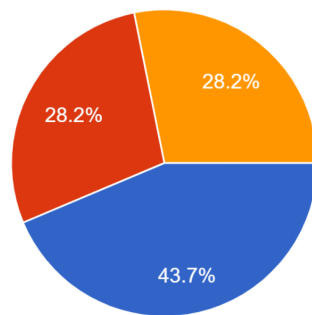

142 responses

- Always (I use one primary PIN for almost everything).
- Often (I reuse a few favorite PINs).
- Rarely (I try to make them different, but sometimes reuse).
- Never (Every app gets a unique, randomly generated PIN).

Question 4: (Risk Perception) If an acquaintance knew your basic personal info (Date of Birth, phone number, graduation year), do you think they could guess your phone's PIN within 10 attempts?

142 responses

- Yes, it is highly likely they would guess it.
- Maybe, it's possible but would require luck.
- Absolutely not, my PIN is completely unrelated to my personal information.
